

Peter Day

Peter is a mostly-retired environmental consultant. He has run his business (Peter R Day Resource Strategies) for over twenty years providing planning and communication services to natural resource management bodies and research institutions, especially those related to primary production and rural issues. He has worked across Australia and across most agricultural commodities on topics including:

- Planning regional and catchment-wide programs for natural resource management, with special expertise in soil, nutrients, water resources and climate change.
- Designing, managing, and evaluating research programs; especially ones with a mix of environment and primary production.
- Communication planning and science writing, especially knowledge harvesting and presenting whole-of-program results.
- Facilitation and community consultation; helping people share understandings and find common ground, including the negotiation of native title agreements.

Prior to consulting, Peter worked as a planner then manager in State Government, and as a natural resources policy executive for the SA Farmers Federation. His professional qualifications include science (ecology), natural resources and business administration. He has minor qualifications in real estate and in the anthropology of native title, and has combined his passion for the underwater world with science writing to produce 'Sea Creatures and Seashores' an underwater guide to the marine life of southern Australia.
